1970

Jerry W. Fielder, Director
California Department of Agriculture

The Honorable Board of Supervisors
County of Kern

Telephone 327-2111
Ext. 2306, Area Code 805

The Annual Crop Report for the County of Kern is submitted in accordance with Section 2279 of the Agricultural Code. The values quoted are gross FOB figures and do not represent net income to the farmers of this county. Production costs continue to spiral and farmers find it increasingly difficult to keep net figures in the black. This is particularly true with small growers who do not have the leverage to combat production costs.

The estimated value of all crops produced during 1970 is \$345,903,460, which is \$25,627,200 more than the 1969 total of \$320,276,260. Total harvested acres increased to 836,878 from 747,248.

Cattle and calves remained in top position on the list of most valuable crops. Fewer head were marketed, total production weight remained about the same, and price per pound received was just a little higher.

Cotton was the second most valuable crop. Total acreage was down to 171,000 from the 178,000 harvested in 1969. Yield per acre was also down slightly, but the average price per pound improved and total returns for the crop increased from \$49,198,000 to \$54,196,000. The crop got off to a late start due to unfavorable weather at and after planting time, but conditions were better during the balance of the year which helped make up for some of the lateness. Live pink bollworm larvae were again discovered in the county, the first since November 1967, and producers were alerted to the danger of letting this pest become established. Every attempt was made to bring the county into compliance with the host-free period for it is felt this is still the most effective means of combating pink bollworm, the most destructive pest known to cotton.

The late spring potato crop was generally profitable for producers. The season got off to one of the earliest starts in recent years, but cool temperatures during the last half of April retarded maturity and volume shipments did not begin until the month of May. As a result of near perfect weather during the balance of the growing season over 80% of the crop was harvested before the end of June. From a total of 39,690 acres, which was a decrease of 5% from the 1969 harvested acreage of 41,940, returns to growers increased to \$45,734,700 from \$36,309,500 received in 1969.

1970 records show that acreage and production of raisin and table varieties of grapes decreased while acreage and production of wine varieties increased. Prices were better on all varieties and the \$41,264,000 received for the entire crop was 8% higher than the previous year.

Thirty-one commodities have an estimated value of over one million dollars each, but large or small, profitable or unprofitable, each crop planted and produced represents the efforts of untold individuals who work toward bringing the finest food and fibre possible to the consuming public.

We sincerely appreciate the effort and cooperation of all who supplied the information which made this report possible.
